1 Basic Shell Commands

Shell Command	Explanation
cd filepath	change directory aka move into a different folder
ls -lh folder	list the files and folders in your current directory
pwd	show path of working directory aka the folder that you're in
	right now
$ exttt{touch } fname$	make a new file
mkdir $dirname$	make a new directory aka a folder
${ t rm}\; fname$	remove aka delete a file or directory
cp original-fname copied-fname	c o p y a file or directory
mv original-fname new-fname	move or rename a file or directory
cat $fname$	show all the contents of a file
more fname	show snippet of a file that allows you to scroll through the entire thing
$\mathtt{head}\; fname$	show the first 10 lines of a file (change number of lines by
	adding a flag, e.g. head -100)
ail fname	show the last 10 lines of a file (change number of lines by
	adding a flag, e.g. tail -100)
wc -w -1 $fname$	show how many w ords or lines in a file
man command	show the manual aka the documentation that tells you what
	a particular command does
echo	print text to the command line
egrep "search pattern" fname or dirname	search for lines that include search term in file. See below for
	the arguments of egrep.
wget url	get a file from the web

This cheatsheet is based on this resource. Please also refer to this resource for a more in-dept explanation in prose. You should follow the guide for macOS and Unix even as a Windows user as we have installed a Unix environment.

1.1 egrep

The most common arguments of egrep:

- -i search case insensitive
- -r search recursively in folder
- -o show exact matches only instead of entire lines with matches
- -h suppress the file path where the match occurred

1.2 Operators

• 1: A pipe takes the output of one command and passes it as the input to another.

```
echo "pass this text to next command" | cat
```

 $\bullet\,$ >: This operator redirects the output to a file (overwrites if it already exists). Example:

```
echo "first line of file1" > file1
```

• >>: This operator redirects and appends the output to an *existing* file: Example:

```
echo "line following existing content of file1" >> file1
```

2 NLP-related Shell Commands

coming soon!

3 Regular Expressions

3.1 Example Patterns

```
# alle Kleinbuchstaben
echo "Das ist ein Satz mit der Zahl 1000" | egrep --colour "[a-z]"

# alle Grossbuchstaben
echo "Das ist ein Satz mit der Zahl 1000" | egrep --colour "[A-Z]"

# das Wort "ist" und das nächste Wort
echo "Das ist ein Satz mit der Zahl 1000" | egrep --colour "ist [a-z]*"

# das Wort "Zahl" gefolgt von einer Ziffer
echo "Das ist ein Satz mit der Zahl 1000" | egrep --colour "Zahl [0-9]"

# das Wort "Zahl" gefolgt von beliebig vielen Ziffern
echo "Das ist ein Satz mit der Zahl 1000" | egrep --colour "Zahl [0-9]*"
```

3.2 Pattern Equivalence

```
a+ == aa*  # "a" once or more than once

a? == (a|_)  # "a" once or nothing

a{3} == aaa  # three "a"

a{2,3} == (aa|aaa)  # two or three "a"

[ab] == (a|b)  # "a" or "b"

[0-9] == (0|1|2|3|4|5|6|7|8|9)  #any digit
```
