3	Regular Expressions	2

## 1 Basic Shell Commands

Shell Command	Explanation
cd filepath	change directory aka move into a different folder
ls -lh $folder$	list the files and folders in your current directory
pwd	show <b>p</b> ath of <b>w</b> orking <b>d</b> irectory aka the folder that you're in right now
touch $fname$	make a new file
mkdir dirname	make a new directory aka a folder
rm fname	remove aka delete a file or directory
cp original-fname copied-fname	copy a file or directory
mv original-fname new-fname	move or rename a file or directory
cat $fname$	show all the contents of a file
more fname	show snippet of a file that allows you to scroll through the entire thing
head $fname$	show the first 10 lines of a file (change number of lines by adding a flag, e.g. head -100)
ail fname	show the last 10 lines of a file (change number of lines by adding a flag, e.g. tail -100)
wc -w -1 fname	show how many words or lines in a file
man command	show the <b>man</b> ual aka the documentation that tells you what a particular command does
echo	print text to the command line
<pre>grep "search term" fname or dirname</pre>	search for lines that include search term in file
${ t wget} \ url$	get a file from the web

This cheatsheet is based on this resource. Please also refer to this resource for a more in-dept explanation in prose. You should follow the guide for macOS and Unix even as a Windows user as we have installed a Unix environment.

#### 1.1 Operators

• |: A pipe takes the output of one command and passes it as the input to another.

```
echo "pass this text to next command" | cat
```

 $\bullet\,\,$  >: This operator redirects the output to a file. Example:

```
echo "first line of file1" > file1
```

• >>: This operator redirects and append the output to an existing file: Example:

```
echo "line following existing content of file1" >> file1
```

#### 2 NLP-related Shell Commands

coming soon!

### 3 Regular Expressions

#### 3.1 Example Patterns

```
# alle Kleinbuchstaben
echo "Das ist ein Satz mit der Zahl 1000" | egrep --colour "[a-z]"

# alle Grossbuchstaben
echo "Das ist ein Satz mit der Zahl 1000" | egrep --colour "[A-Z]"

# das Wort "ist" und das nächste Wort
echo "Das ist ein Satz mit der Zahl 1000" | egrep --colour "ist [a-z]*"

# das Wort "Zahl" gefolgt von einer Ziffer
echo "Das ist ein Satz mit der Zahl 1000" | egrep --colour "Zahl [0-9]"

# das Wort "Zahl" gefolgt von beliebig vielen Ziffern
echo "Das ist ein Satz mit der Zahl 1000" | egrep --colour "Zahl [0-9]*"
```

#### 3.2 Pattern Equivalence
